Remotion

Remotion is a motion based remote controller running on your iPhone and controlling your Mac.

For Desktop

Use your phone as a laser pointer or as a WiiMote, point, click, drag with natural movements.

For Games

Hold your phone as a gun, and control your favorite first-person shooter with natural movements. Besides cursor buttons and left/right mouse button, you have 10 additional buttons you can use.

Usage

Remotion needs the host application running on your Mac. You can send the host application to your Mac by clicking on the "**SEND HOST APPLICATION TO COMPUTER**" button. On your Mac, double-click on RemotionHost.dmg, and move RemotionHost.app to your applications folder, and open it.

Once the host application is running, just click "**CONNECT TO HOST**" button on your phone, and it connects to the host application immediately.

Your iPhone and your Mac should be connected to the same network to make Remotion work.

When controlling, you can push the home button any time to cancel remote control, and you can connect again any time. With reconnecting, you also re-center the mouse on your Mac.

In case of desktop control, you can move mouse pointing center left and right by rolling your phone clockwise/counterclockwise heavily.

Enjoy the application!
